RDA Brakes recently approached Andrew at Best Practice lighting to consult on a number of customised warehouse LED lighting opportunities first to reduce our power running costs but mainly to increase our internal lighting within our new internal warehouse fit out at one of our warehouse buildings which is highly customised and designed to increase stock capacity which required customised fitment of lighting high to the internal roof line and fitted with various power saving features included power down and then off if no motion occurs within a set time which is personally timed by us to further reduce power costs if lighting is not required within each roof light, aisle or even within the entire internal building which will also preserve and extend the life of each lamp and covers to lower maintenance and running costs, and we also do not need to turn the lights switch to the off position ever again.

Andrew is very passionate with LED lighting designs and fitment options to suit each project, Andrew is very hands on throughout the project from start to the finished fit out which was completed on time and covered with a Best Practice Lighting warranty we highly recommend Best Practice Lighting and Andrews passionate personal service.
